## Monteiro analysis

- As expected, the weather becomes warmer as one approaches the equator (0 Deg. Latitude), and as we are close to the Spring Equinox, we would anticipate that the Southern Latitudes are warmer than the Northern Latitudes at this time of year.
- There is no strong relationship between latitude and cloudiness. Considering that the data seems to cluster around certain y-values, it's my guess that most scientists estimate the value on a categorical scale [0, 25, 50, 75, 100]
- There is no strong relationship between latitude and wind speed. Possibly with a larger dataset there might be more definition to a curve that looks somewhat like the inverse of the temperature curve (that is, where it is cooler, there is a greater chance of higher wind, so it is more likely to be windy the farther you are from the Equator). But for now we probably can't say anything definitive..

## Generate Cities List

## Perform API Calls

- Perform a weather check on each city using a series of successive API calls.
- Include a print log of each city as it's being processed (with the city number and city name).

## Plotting the Data

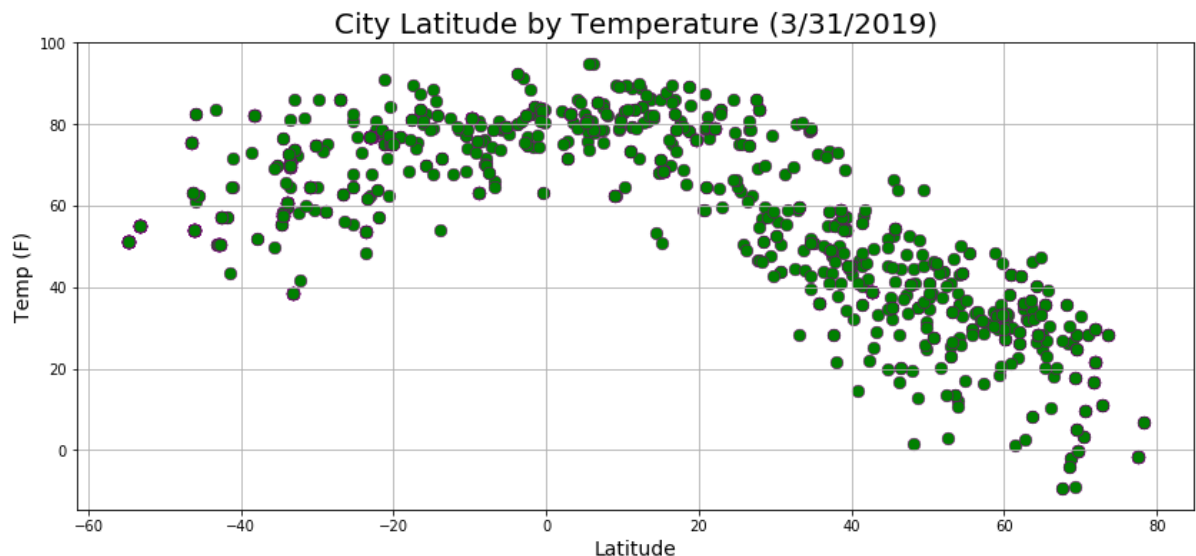

- Use proper labeling of the plots using plot titles (including date of analysis) and axes labels.
- Save the plotted figures as .pngs.

### Latitude vs. Temperature Plot
